

Wave IMpulse

An integrated, secure and private Instant Messaging (IM) solution enabling businesses to easily capture the communications and productivity benefits that IM can offer to an organization.

Powerful Communication

Wave IMpulse combines an internal IM server and a client that is built into ViewPoint®, along with management and security capabilities to give an organization complete control over IM messaging:

- Feature rich IM server and client integrated with Wave IP® and ViewPoint
- IM traffic identification, monitoring and logging
- A private and secure (encrypted) IM server/network
- Keyword Notification and Content Policy Management

Call Recording, Presence Management and secure Instant Messaging are just some applications that are available with ViewPoint at no additional charge.

Easy to Use

Administrators can simply enable a user to use IM with one click, and ViewPoint is updated with IM capabilities. And user deployment features, such as an easy email rollout-and-install process, make ViewPoint with IM a virtually administration-free solution.

No additional License Costs or Hardware

Wave IMpulse is a standard software feature on all Wave IP systems. Wave IMpulse is integrated with Vertical's award winning ViewPoint client that offers call control, presence, visual voicemail, call logs, softphone, and mobility capabilities. There are no additional license costs and no additional hardware is required – nothing could be simpler.

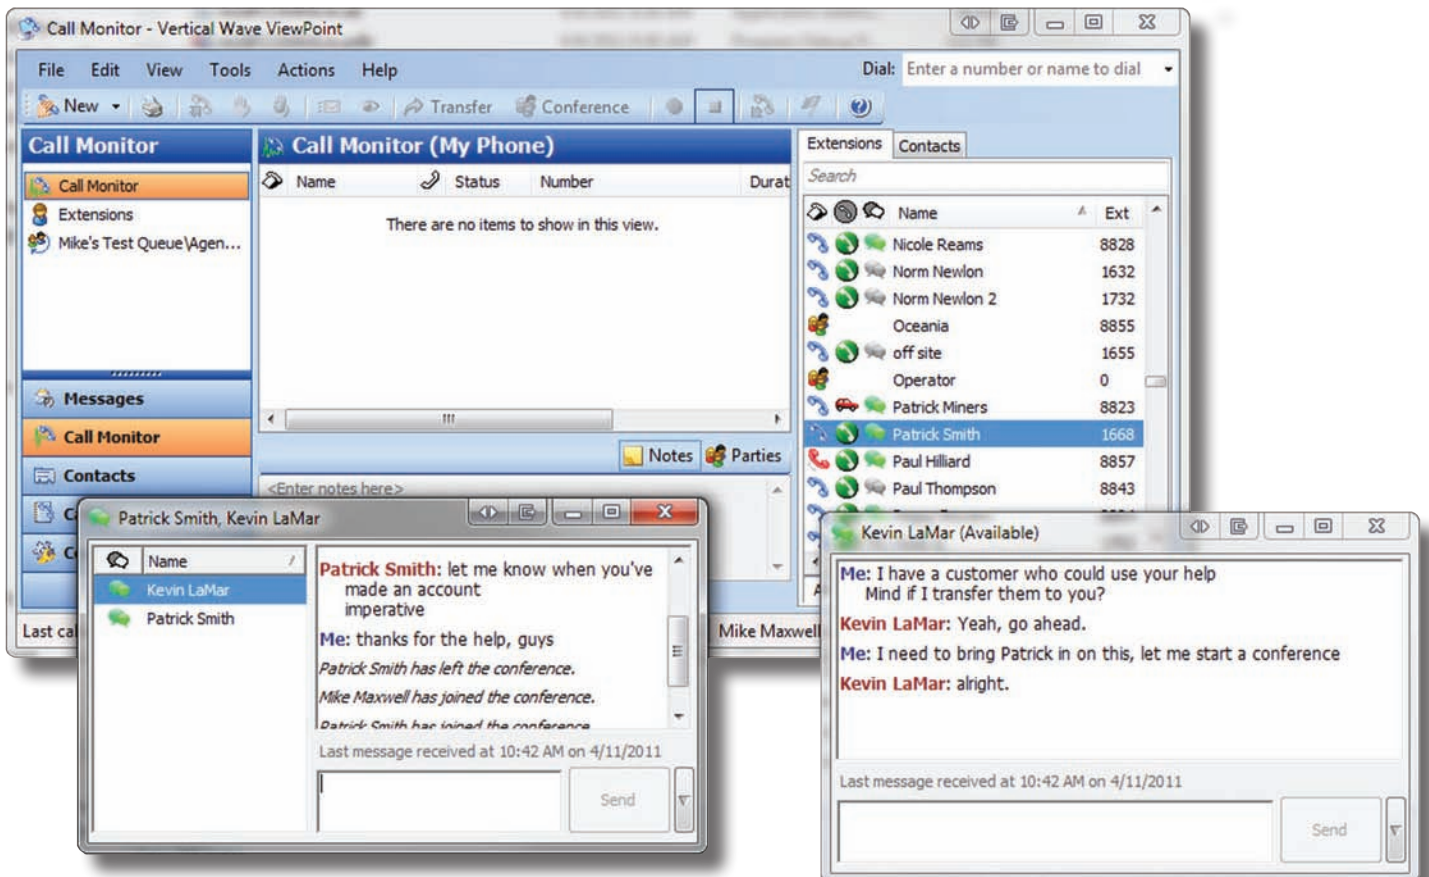

Secure

Wave IMpulse is a private and highly secure IM solution with message encryption utilizing Secure Sockets Layer (SSL) certificates. The encryption used

by SSL turns conversations and confidential information that may be used in communications into useless bits of information. Only the right recipient – with the encryption key – can decode the messages. This means that you have a private communication channel. Wave IMpulse offers 256 bit message encryption for maximum security.

Collaborate Across Locations

ViewPoint is the ultimate collaboration and communications tool for employees. A rich client interface allows you to create buddy lists to see your team or view the entire organization. ViewPoint's intuitive interface means very little training is needed and adoption is fast. Nothing could be easier to bring your organization closer together.

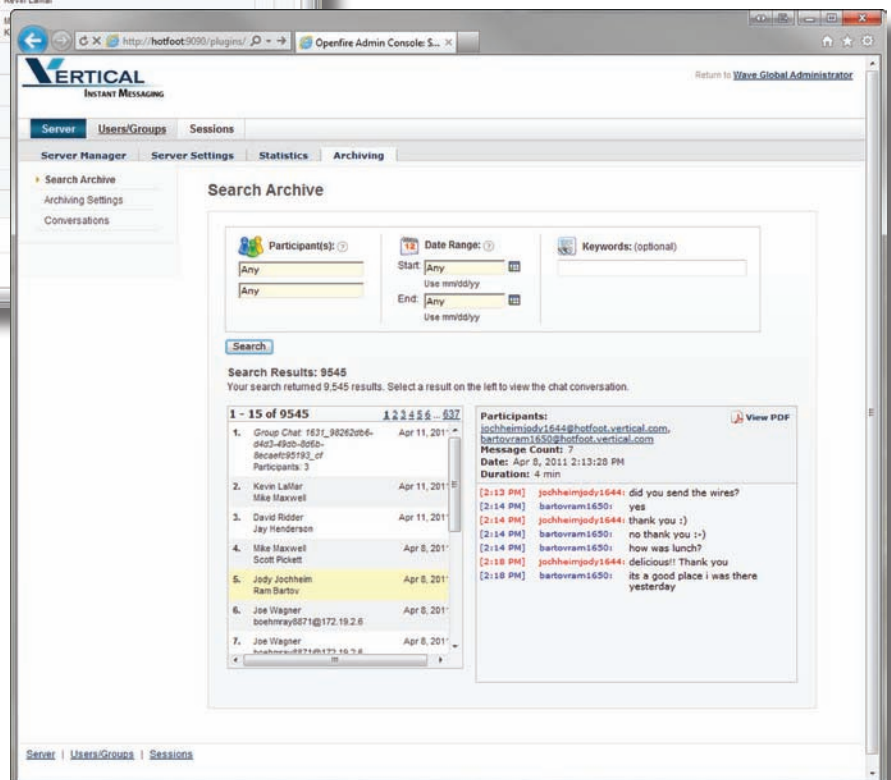

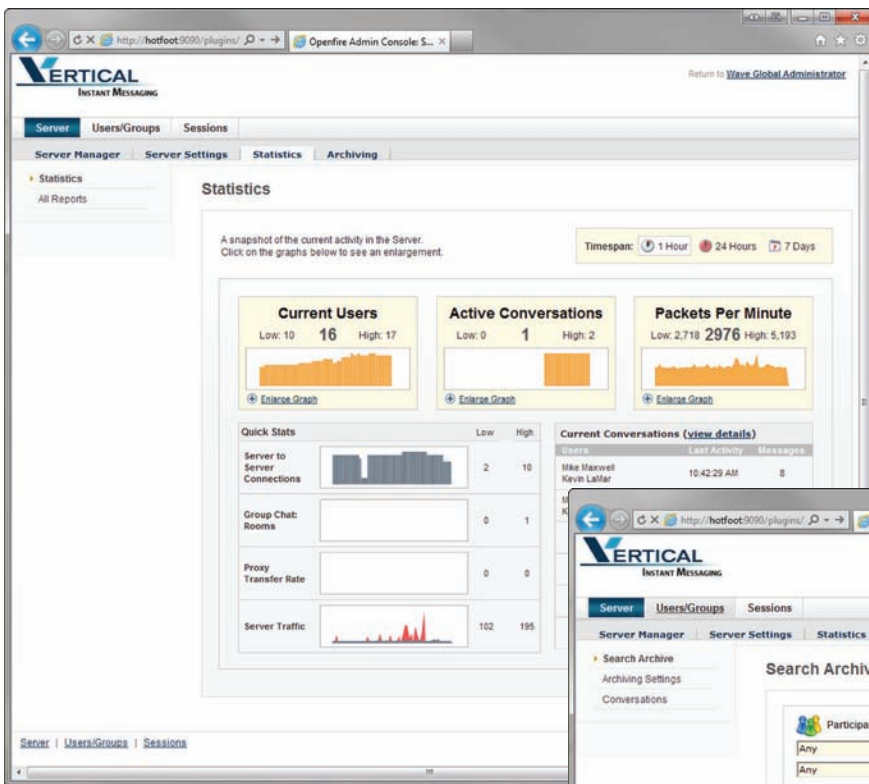

Users can see the availability status of colleagues locally or across locations and reach out to them with a simple click to initiate a call, a conference or secure Instant Message.

Rich Centralized Administration Capabilities

- **Easy to Use Web based administration interface:** Intuitive administration console to manage and control all IM usage and policies for your organization.
- **Flexible Content Management and Keyword tools:** Administration features enable you to make sure your users are adhering to your policies. Tag key words and phrases to be identified, removed or blocked entirely. Notification can be automatic when violations occur.

- **Logging and reporting:** Every IM communication is logged and can be easily converted into reports. Reporting on client connections and usage, server connections, network usage and more are available. Search message archives by date, time, keyword or just browse.
- **End user controls:** IM preferences can be easily standardized across the organization.

Robust administration capabilities allow organizations to generate detailed usage reports and ensure compliance with corporate policies on Instant Message usage by its employees.
